A 100-word explanation of how you implemented the behavior:

I implemented a lot today but I created the Nav Plane for the mob to be on that covers all of the blue/steel area, then I created two patrol points for the mob to be following when the game starts. Then after he starts moving, I added in a custom script to the game that flips the sprite so that it looks cooler. I also added an animation/new object to the key so that it's not just static. I created more Nav Planes for each platform on the game so that I can have mobs in the future on those planes.
