A 100-word write-up explaining how you did both health and matching:

In class today, we went over how to create scriptable objects and create a Float rather than an Integer for the % of health. We went over how to create an image or canvas to show the float in game. How it works is that the health bar is tied to the float# for the actual value of the health, when taking damage, the healthbar reflects the changes to the actual float#. Matching works in a similar way, where it looks for a name ID and only has something happen if the object that is touching it also has that same name ID. I did a lot of the changes that I have been working on for a while in class today. I added in the lever for my door so that you can open and close the door. I also messed around with the Box2Lives object and beefed with that. I also felt like my level was getting a little crowded so I am going to be working to extend it horizontally rather than vertically to make things still seeable but less crowded.
